Abstract

The system dynamics approach is a holistic way of solving problems in real-time scenarios. This is a powerful methodology and computer simulation modeling technique for framing, analyzing, and discussing complex issues and problems. System dynamics modeling and simulation is often the background of a systemic thinking approach and has become a management and organizational development paradigm. In this paper, we present a generic cross impact analysis approach developed for understanding the factors influence the primary education quality and also share the applications of this approach in real-time scenarios (in India, and Turkey).
